

Financial Inclusion Dashboard

Analysis of Bank Account Ownership Across East Africa

Submitted By:

Suraj Nayak

Tools Used:

Power BI, Canva

Dataset:

Financial Inclusion in Africa Dataset

Project Overview

Objective

The objective of this project is to analyze financial inclusion and understand the factors influencing bank account ownership across East African countries.

The dashboard provides valuable insights into demographic, educational, and geographical patterns associated with financial access.

- Dataset Information
- Dataset Name: Financial Inclusion in Africa
- Total Respondents: 23,524
- **Countries Covered:**
 - Kenya
 - Rwanda
 - Tanzania
 - Uganda
- Tool Used: Power BI

Key Performance Indicators (KPIs)

- Total Respondents
- Bank Account Holders
- Financial Inclusion Rate
- Average Age of Respondents

Dashboard Overview

Interactive Dashboard Features

The dashboard was designed to provide stakeholders with an interactive and visual understanding of financial inclusion trends.

Dashboard Components

- KPI Cards for summary statistics
- Bank Account Ownership Analysis
- Country-wise Financial Inclusion Analysis
- Urban vs Rural Comparison
- Gender-wise Analysis
- Education Level Analysis
- Age Group Distribution
- Interactive Slicers for filtering data

Filters Used

- Country
- Year
- Gender
- Location Type
- Education Level

Key Findings

Major Insights from the Dashboard

Financial Inclusion Status

- Total Respondents: 23,524
- Bank Account Holders: Approximately 3,309
- Financial Inclusion Rate: 14.07%
- Average Age: 38.80 Years

Country Analysis

- Kenya shows the highest level of bank account ownership.
- Rwanda, Tanzania, and Uganda show comparatively lower levels of financial inclusion.
- Significant differences exist among countries in access to banking services.

Demographic Analysis

- Urban residents are more likely to own bank accounts than rural residents.
- Financial inclusion varies across different age groups.
- Educational attainment has a strong relationship with bank account ownership.

Business Insights and Recommendations

Business Insights

1. Financial inclusion remains relatively low across the surveyed population.
2. Rural populations face greater barriers to accessing banking services.
3. Higher educational levels are associated with higher rates of bank account ownership.
4. Young adults and low-income populations represent potential growth segments for financial institutions.

Recommendations

- Expand banking infrastructure in rural regions.
- Promote financial literacy and awareness programs.
- Develop digital banking solutions for underserved populations.
- Create targeted financial products for youth and low-income groups.
- Strengthen partnerships between governments and financial institutions to improve financial accessibility.

Conclusion

This dashboard successfully demonstrates how data visualization can be used to understand financial inclusion patterns and support informed decision-making.

The analysis reveals that bank account ownership is influenced by factors such as country, education level, location, and age. The insights generated from the dashboard can help policymakers, banks, and financial organizations develop strategies to improve financial inclusion and expand access to formal banking services.
